

## ABSTRACT OF THE DISCLOSURE

A camera includes a release button, an input unit, an A/D converter, a memory, a control unit, an alarm, a recording unit and an output unit. The memory stores data for the image converted by the A/D converter. The control unit judges whether or not the image stored in the memory satisfies a predetermined photographing condition and outputs a timing signal when the image satisfies the photographing condition. The alarm outputs an alarm signal to a photographer. The recording unit records the refined image on a recording medium. The output unit outputs the refined image.
